

IDEALIZE 2026

RENTLOOP

Team Proposal Points

Double-sided rental management platform for tenants and landlords

Use these points to fill Problem & Solution, AI Integration, Technical Design, Market Potential, and Sustainability slides.

Proposal Overview

The uploaded IDEALIZE template asks for a concise team proposal covering the problem, solution blueprint, AI integration, technical architecture, market potential, and sustainability. The template also indicates that extra content should not exceed 6 slides, so the content below is arranged as 6 slide-ready sections.

Suggested basic details

- Team Name:** choose your team name
- Category:** Web/App
- School / Open:** Open or School category based on your team
- Name of the web/app:** RentLoop
- Field:** PropTech / FinTech / Rental Management / AI-enabled Property Services

One-line concept

Pitch

RentLoop is a double-sided rental management platform that connects tenants and landlords through shared rent records, digital receipts, lease reminders, maintenance tickets, evidence reports, and AI-powered rental guidance.

Recommended 6-slide structure

Slide	What to add
1	Problem Statement - fragmented rental management and disputes
2	Application Blueprint - tenant and landlord workflows
3	Agentic AI Integration - agents for contracts, payments, maintenance, communication, evidence
4	Technical Architecture & Feasibility - frontend, backend, AI, payment, security
5	Market Potential & Revenue - tenant-only and landlord-connected revenue models
6	Sustainability & Long-Term Impact - continuous use, trust, expansion

Slide 1 - Problem Statement

Core idea: renting is not only a discovery problem. The bigger issue starts after people rent: payments, receipts, repairs, lease obligations, evidence, and disputes are scattered across WhatsApp, bank slips, paper agreements, and memory.

Points to add

- Tenants struggle to track rent payments, collect receipts, understand agreements, report maintenance issues, and protect their deposit at move-out.
- Landlords struggle to collect rent on time, follow up with tenants, issue receipts, track complaints, store documents, and manage property maintenance professionally.
- Most rental communication happens through informal channels such as phone calls, WhatsApp messages, bank transfer screenshots, and paper agreements.
- Because there is no shared digital record, disputes happen around payment proof, property damage, repair responsibility, notice periods, deposit return, and agreement terms.
- Existing rental platforms mainly focus on finding a property, not managing the full rental relationship after the tenant moves in.

Slide-ready problem statement

The rental process in Sri Lanka is fragmented, informal, and difficult to track. Tenants and landlords rely on calls, WhatsApp, bank slips, and paper agreements, which leads to missed payments, delayed maintenance, unclear responsibilities, and deposit disputes. There is a need for a trusted digital platform that manages the full rental lifecycle for both tenants and landlords.

Why this problem matters

Stakeholder	Pain point	Impact
Tenant	No organized rent/receipt history	Payment disputes and stress
Tenant	No structured maintenance record	Repairs get delayed or ignored
Tenant	Weak move-in evidence	Deposit disputes at move-out
Landlord	Manual rent tracking	Time wasted chasing payments
Landlord	Scattered repair complaints	Higher maintenance confusion
Landlord	No property condition record	Harder to prove tenant damage

Slide 2 - Application Blueprint / Solution

RentLoop should be positioned as a rental relationship management platform, not just a listing app and not just landlord accounting software.

Main solution points

- A two-sided mobile/web platform for tenants and landlords to manage the complete rental lifecycle.
- Tenant can start alone by adding rental details, payment reminders, agreement, and maintenance logs.
- Tenant can invite landlord later for payment confirmation, digital receipts, and maintenance approvals.
- When both sides join, the app becomes a shared rental portal with verified records and reduced disputes.
- Maintenance issues can later connect to verified technicians, creating a natural expansion into a service marketplace.

Feature map

Feature	Tenant benefit	Landlord benefit
Rent reminders	Avoid late payments	Less manual chasing
Payment proof & receipts	Proof of payment	Clear rent ledger
Agreement upload	Understand key terms	Store lease documents
AI contract summary	See due dates, notice periods, risks	Know obligations and deadlines
Maintenance tickets	Report issues properly	Track repairs clearly
Move-in evidence	Protect deposit	Protect property condition
Move-out report	Support deposit recovery	Verify damage claims
Shared communication log	Proof of messages	Organized tenant records

Simple user flow

Landlord creates property -> Tenant joins or tenant starts alone -> Agreement uploaded -> Rent schedule generated -> Payments logged and confirmed -> Maintenance issues tracked -> Move-in/move-out evidence stored -> Tenancy closed with final report and optional review.

Slide 3 - Agentic AI Integration

AI should not be presented as just a chatbot. It should act as a set of task-focused agents that reduce confusion, automate records, and guide both sides through rental workflows.

AI agent	What it does	Real benefit
Lease Understanding Agent	Reads uploaded agreements and extracts rent amount, due date, deposit, notice period, renewal terms, and repair responsibilities.	Turns legal-looking text into reminders and understandable obligations.
Payment Reconciliation Agent	Reads bank slips/screenshots and matches them against monthly rent dues.	Reduces payment disputes and helps landlords issue receipts faster.
Maintenance Triage Agent	Classifies tenant issues from text/photo/video into plumbing, electrical, leak, pest, appliance, etc.	Creates clear maintenance tickets and urgency levels.
Communication Agent	Drafts polite messages in English, Sinhala/Tamil-transliterated text, Singlish, or Tanglish.	Improves communication between tenants and landlords.
Evidence & Dispute Agent	Creates a timeline from photos, receipts, messages, and issue reports.	Generates deposit or repair dispute packs when needed.
Rental Risk Agent	Checks listings/chats for suspicious advance requests, fake landlord behaviour, reused images, or pressure language.	Protects tenants before paying advance.

Agentic workflow example

Tenant uploads a photo of a leaking sink -> Maintenance Agent identifies a plumbing issue -> creates a structured ticket -> Communication Agent drafts the landlord message -> Landlord approves repair -> technician work photos are attached -> Evidence Agent updates the repair timeline and warranty record.

Important AI safety note

- AI should provide guidance and risk flags, not final legal advice.
- For lease disputes or legal uncertainty, the app should recommend professional/legal review.
- Payment and document actions should maintain audit logs so both sides can trust the record.

Slide 4 - Technical Architecture & Feasibility

The MVP can be built without complex integrations first. Start with manual payment proof uploads, agreement storage, reminders, and maintenance tickets. Add connected payments and technician marketplace later.

Layer	Suggested implementation
Frontend	Mobile app for tenants and landlords; optional web dashboard for landlords. React Native / Flutter for mobile and React / Next.js for web.
Backend API	Node.js / NestJS / Ballerina backend with REST APIs, role-based access, and audit logs.
Database	PostgreSQL with tables for users, properties, tenancies, rent schedules, payments, receipts, maintenance tickets, documents, evidence events, and AI findings.
Storage	Secure document/photo storage for agreements, payment slips, move-in photos, repair images, and generated PDFs.
AI services	OCR for agreements/receipts, LLM for summaries/messages, image AI for maintenance classification and move-in/move-out comparison.
Payments	MVP: bank transfer proof upload and landlord confirmation. Later: PayHere, JustPay, LankaQR or bank integration depending on fees and feasibility.
Security	Encrypted storage, tenant/landlord permissions, consent-based sharing, audit logs, and verified account flows.

MVP development phases

Phase	Scope
Phase 1	Tenant app: rental profile, agreement upload, rent reminders, payment proof, maintenance log, move-in evidence.
Phase 2	Landlord dashboard: property list, tenant ledger, payment confirmation, receipts, maintenance tickets.
Phase 3	AI features: contract summary, maintenance assistant, message generator, evidence timeline.
Phase 4	Payment integration, digital receipts, arrears reports, landlord analytics.
Phase 5	Verified reviews, technician marketplace, listing verification, property manager tools.

Slide 5 - Market Potential & Revenue Model

The product has stronger retention than a simple property-search app because renting creates monthly and event-based usage: rent, receipts, utilities, repairs, renewals, inspections, and move-out.

Target users

- Tenants: students, young professionals, families, annex tenants, boarding house tenants, and commercial/shop renters.
- Landlords: individual property owners, annex owners, boarding house owners, owners with multiple units, and small property managers.
- Future partners: maintenance workers, cleaning services, movers, insurance/guarantee providers, and verified listing partners.

Revenue model

Situation	How app can earn
Tenant only	Free basic tracker, paid AI contract review, rental scam check, move-in evidence report, deposit recovery pack.
Landlord connected	Monthly landlord subscription per property/unit for ledgers, receipts, maintenance records, reminders, and reports.
Payments enabled	Small flat platform fee or convenience fee; avoid relying only on a percentage of rent because rent amounts are large.
Maintenance flow	Commission or lead fee from verified technicians when landlord/tenant books repair through the app.
Listings later	Verified listing fee, tenant onboarding fee, property profile boost, and application management tools.

Key business logic

Do not depend only on rent commission. Rent payments are high-value and users may resist percentage fees. Use landlord subscriptions, tenant protection packs, payment convenience fees, and maintenance commissions as mixed revenue streams.

Slide 6 - Sustainability & Long-Term Impact

RentLoop remains relevant because it is used throughout the rental lifecycle, not only when searching for a property.

Sustainability points

- Continuous monthly usage through rent reminders, payment proofs, receipts, utility tracking, and landlord confirmations.
- Event-based usage through maintenance issues, contract renewals, move-in inspections, move-out reports, and deposit return.
- Shared records reduce disputes and create trust between tenants and landlords.
- Digital ledgers and receipts help landlords manage multiple properties more professionally.
- Maintenance tickets create a future path to a verified technician marketplace.
- Verified rental histories and landlord/tenant reputation can improve future rental decisions.

Long-term expansion

Expansion area	How it grows
Student rentals / boarding houses	Manage multiple tenants, shared bills, room changes, and house rules.
Commercial rentals	Rent schedules, deposits, shop maintenance, and contract reminders.
Property manager tools	Multi-property dashboards, reports, owner statements, and technician coordination.
Technician marketplace	Repair request -> quote -> approval -> before/after proof -> warranty.
Rental listing verification	Use historical records and verified landlord profiles to improve trust in listings.

Long-term impact statement

RentLoop can formalize Sri Lanka's rental experience by replacing scattered WhatsApp messages, paper agreements, and manual payment tracking with a trusted digital rental record. It benefits tenants through protection and clarity, while helping landlords reduce admin work, collect rent efficiently, and maintain their properties better.

Bonus - Presentation Lines

Use these lines when explaining the idea quickly.

30-second pitch

RentLoop is a double-sided rental management platform for tenants and landlords. It manages rent payments, receipts, agreements, maintenance requests, move-in evidence, and move-out protection in one place. AI agents summarize contracts, classify maintenance issues, generate messages, verify payment records, and create evidence reports, helping both sides reduce disputes and manage rentals more professionally.

Strong points to say verbally

- We are not building another listing app; we are building the system used after someone rents.
- Tenant-only mode helps us acquire users without waiting for landlords.
- Landlord mode creates stronger monetization through management tools and payments.
- Maintenance creates the path to a verified technician marketplace later.
- AI is used to reduce confusion and automate records, not just to act as a chatbot.
- The main value is trust, proof, records, and reduced disputes.
